

## **ABSTRACT**

2 A child positioning apparatus for X-ray photography having  
3 improved adjustment mechanisms. In particular the positioning of  
4 the X-ray film cassette has been improved by using a friction  
5 fastner. The friction fastner passes through a groove in the  
6 vertical portion of a L-bracket and attaches to a tray for  
7 holding the X-ray film. The position of the tray is adjusted by  
8 loosening the friction fastener, positioning the tray and then  
9 re-tightening to fix the X-ray film cassette into place.
